                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AC027787
                                                                                                                                                             NOTE: This record contains 163 individual sequencing reads that have not been assembled into contigs. Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced.
                                                                      However, it should not be assumed that this clone will be sequenced to completion. In the event that the record is updated, the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         (bases 1 to 138097)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Birren,B., Linton,L., Nusbaum,C. and Lander,E. Homo sapiens chromosome 15, clone RP11-196E16
NOTE: This record contains 163 individual sequencing reads that have not been assembled into sequencing reads that used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows in the partial sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Dodge,S., Domino,M., Doyle,M., Ferreira,P., FitzHugh,W.,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Eukaryota; Metazoa; Chordata; Craniata; Vertebrata;

* NOTE: This is a 'working draft' sequence. It currently consists of 15 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

It currently consists of 19 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Submitted (06-JAN-2000) Masahira Hattori, The Institute of Physical and Chemical Research (RIKEN), Genomic Sciences Center (GSC); 1-7-22 Suehiro-chou, Tsurumi-ku, Yokohama, Kanagawa 230-0045, Japan (E-mail:hattori@gsc.riken.go.jp, URL:http://hgp.gsc.riken.go.jp/, Tel:81-45-503-9111, Fax:81-45-503-9170)

159605 159679 contig of 75 bp in length
159780 162418 contig of 2639 bp in length
162519 165383 contig of 2865 bp in length
162519 165383 contig of 1321 bp in length
165484 166804 contig of 1321 bp in length
165484 166804 contig of 1321 bp in length
165486 19 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               64279 64378; gap of 100 bp 64279 77579; contig of 13201 bp in length 77580 77679; gap of 100 bp 100 pp 100

Center project Information

Center project name: 112709

Center clone name: 729_B.4

Sequencing vector: Plasmid; n/a; 100% of reads
Chemistry: Dye-terminator Big Dye; 100% of reads
Assembly program: Phrap; version 0.960731

Consensus quality: 166378 bases at least Q40

Consensus quality: 16639 bases at least Q20

Insert size: 116700; agarose-fp

Quality coverage: 12.2 in Q20 bases; sum-of-contigs

Quality coverage: 12.9 in Q20 bases; sum-of-contigs

NOTE: This is a 'working draft' sequence. It currently consists of 15 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      149023 154159: contig of 51

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence encoding for a novel human membrane protein includes the flanking 5'- and 3'- sequences. Four amino acid sequences for novel human membrane proteins (AMU01210-AAU01213) are given in the present invention. These membrane proteins share structural similarity with membrane receptors such as the IgE receptor and mammalian CD20. The novel human membrane proteins are useful for identifying agonist, antagonist and modulators of the membrane proteins. The membrane proteins can be used for diagnosis, drug screening, pharmacogenomic applications, clinical trial monitoring and the treatment of physiological disorders and diseases. The polynucleotides encoding the membrane proteins can be used to generate PCR primers or probes to identify mutations associated that the content of the second content of the membrane proteins can be used to generate PCR primers or probes to identify mutations associated that the content of the second content of the membrane proteins can be used to generate PCR primers or probes to identify mutations associated that the content of the second content of the membrane proteins can be used to generate PCR primers or probes to identify mutations associated that the content of the second content of the membrane proteins can be used to generate PCR primers or probes to identify mutations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence

                                                                                                                                                                                                                                                   The invention relates to full length GENSET human nucleic acids encoding potentially secreted proteins. The nucleic acids and the polypeptides they encode may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate GENSET gene expression. For CENSET gene expression by rectifying mutations or deletions in a patient's genome that affect the activity of GENSET or by supplementing the patients own production of GENSET polypeptides. Conversely, antisense nucleic acid molecules may be administered to down regulate CENSET expression by binding with the cells' own genes and preventing their expression. The sense and antisense nucleic acids may also be presence of similar nucleic acid sequences in samples, and hence to the GENSET polypeptides may be in need of restorative therapy. The GENSET polypeptides may be used as antigens in the production of antipodies and in assays to identify modulators (agonists and cantipodies) of GENSET polypeptide expression and activity. The present sequence is a GENSET nucleic acid of the invention.

The present sequence encodes for novel human membrane protein #1. Human membrane protein #1 is 1 of 4 human membrane proteins (AAU01210-AAU01213) given in the present invention. These membrane proteins share structural similarity with membrane receptors such as the IgE receptor and mammalian CD20. The novel human membrane proteins are useful for identifying agonists, antagonists and modulators of the membrane proteins, and for producing antibodies specific to the drug screening, pharmacogenomic applications, clinical trial monitoring and the treatment of physiological disorders and diseases. The polynucleotides encoding the membrane proteins can be used to generate polynucleotides encoding the membrane proteins can be used to generate polynucleotides on probes to identify mutations associated with a particular disease.
                                                                                                                                                                                                                                                                                                                                        Polynucleotide encoding novel human membrane identifying agonist, antagonist or modifiers antibodies useful in therapeutic, diagnostic applications

The membrane proteins can be used for diagnosis, drug screening, pharmacogenomic applications, clinical trial monitoring and the treatment of physiological disorders and diseases. The polynucleotides encoding the membrane proteins can be used to generate PCR primers or probes to identify mutations associated with a particular plant of the process of the membrane proteins can be used to generate polynucleotides and the treatment of physiological disorders and diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Polynucleotide encoding novel human membrane protein, useful for identifying agonist, antagonist or modifiers or for producing antibodies useful in therapeutic, diagnostic and pharmacogenomic
                                                                                                                                                                                                                               Sequence 450

```

The present sequence encodes for novel human membrane protein #3. Human membrane protein #3 is 1 of 4 human membrane proteins (AAU01210-AAU01213) given in the present invention. These membrane proteins share structural similarity with membrane receptors such as the IgE receptor and mammalian CD20. The novel human membrane proteins are useful for identifying agonists, antagonists and modulators of the membrane proteins, and for producing antibodies specific to the membrane proteins. The membrane proteins can be used for diagnosis, drug screening, pharmacogenomic applications, clinical trial monitoring and the treatment of physiological disorders and diseases. The

sequence. The 5' ESTs were prepared from total human RNAs or polyA+ R derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they a often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of
                                                                                                                     mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5 UTR is rarely included. 5 ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic,

Human membrane protein #2 is 1 of 4 human membrane proteins (AAU01210-AAU01213) given in the present invention. These membrane proteins share structural similarity with membrane receptors such as the IgE receptor and mammalian CD20. The novel human membrane proteins are useful for identifying agonists, antagonists and modulators of the membrane proteins, and for producing antibodies specific to the drug screening, harmacogenomic applications, clinical trial monitoring and the treatment of physiological disorders and diseases. The polynucleotides encoding the membrane proteins can be used to generate polynucleotides encoding the membrane proteins can be used to generate polynucleotides encoding the membrane proteins can be used to generate

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      diseases associated with inappropriate GENSET gene expression. For cexample, they be used to treat disorders associated with decreased GENSET gene expression by rectifying mutations or deletions in a patient's genome that affect the activity of GENSET or by supplementing the patients own production of GENSET polypeptides. Conversely, antisense nucleic acid molecules may be administered to down regulate GENSET expression by binding with the cells' own genes and preventing their expression. The sense and antisense nucleic acids may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acid sequences in samples, and hence to determine which patients may be in need of restorative therapy. The GENSET polypeptides may be used as antigens in the production of antibodies and in assays to identify modulators (agonists and antagonists) of GENSET polypeptide expression and activity. The present sequence is a GENSET nucleic acid of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses on a single surface \,

                                                                                                                       The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                                                and single-nucleotide polymorphisms, monitoring gene expression.
                                                                                                                                                                                                              a single surface

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a composition comprising two nucleoted each containing an electron-transfer group (ETM) having acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatcl and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              a single surface
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses on

                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Q
                                                                The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

                                                                                                                                                                                                                                                                                           The present invention relates to a composition comprising two nucleic acids each containing an electron transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.
